

## Python 2 Homework 4

Next class will be more tkinter work.

Tkinter is good but OOP concepts should be strengthened above package usage knowledge. So for the homework, it will be property tweaking.

1. Create a new property in the class called status.
  - a. This dictates the employment status of an employee, default to "Employed"
  - b. If the employee is set to status "Fired" their email should be erased.
2. Create 10 employees and put them into a list.
3. Print out the 10 employees full names, status and their emails.
